Pharyngotonsillitis: A Quick Review

Sydney Correia Leao
Pathology Assistant, Federal University of São Paulo; Associated Researcher, Group of Molecular Anatomy, Federal University of Sergipe, São Paulo, Brazil

Tonsils and adenoids are part of the lymphoid system that surrounds the pharynx and are involved in humoral and cellular immunity. The tonsils are incomplete encapsulated aggregates of lymphoid nodules, arranged below and in contact with the epithelium of the initial portions of the digestive and respiratory tract. According to their location, they can be called: palatine, lingual and pharyngeal. The tonsils are bilateral and are located at the boundary between the oral cavity and oropharynx. Because of its location, these tonsils come into constant contact with inhaled or swallowed microorganisms, becoming targets for infection.

Pharyngotonsillitis (PT) or Sore Throat (ST) is a self-limiting infection usually confined to the posterior pharynx, tonsils, soft palate and posterior lymph nodes of the lymphatic ring of Waldeyer that drain into the posterior cervical region. The STs are transmitted from person to person, and the nasopharynx and oropharynx are the main foci of microorganisms colonization.

The rate of acute PT incidence was recorded in a study carried out in Portugal by Simões, et al. The incidence of acute sore throat was 3,651.1/105 for the age group of 0 to 4 years; and 3,440.3/105 for the age group of 5 to 9 years and 2,020/105 for the age group of 10 to 14 years.

Sore throats are common in children, and in most cases they are viral. The most common bacterial agent is β-hemolytic Group A Streptococcus (GAS) corresponding to 15% to 20% of cases in children and adolescents; although there are reports of an incidence not greater than 10% in general population.

However, some studies registered non-group A streptococcal (non-GAS) PT. In cultures of pharyngeal exudate, it was found other serogroups of β-hemolytic streptococcus, such as B, C, F and G and there are reports of pharyngitis caused by these groups, especially the C and G.

Streptococcal PT, if not adequately treated, can lead to non-suppurative complications such as rheumatic fever and glomerulonephritis, with high costs and high morbidity especially in developing countries such as Brazil. So the importance of knowing, studying and treating this disease better, is sometimes neglected.
